3rd party libraries and assets

Game engine: libGDX
https://libgdx.com/dev/

Since the assessment is based in Java, we felt libGDX was suitable since it is Java based and easy to learn since it does not force a particular coding style, and some of the team were already familiar with it.

Physics engine: jbump
https://github.com/implicit-invocation/jbump

Since the game was going to be top down and 2D, we had a look at libGDX's popular 2D physics engines. The more popular is Box2D, but since we only needed simple collision physics we decided to go with jbump, which is also tile based which suited the top down map style.

Map editor software: Tiled
https://www.mapeditor.org/

For assessment 1, our map needed to focus on area design and functionality rather than looking appealing or accurate, so instead of an art editor we decided to use Tiled since it had built in compatibility with libGDX- It can be uploaded directly, and has functionality such as being able to detect the codes of tiles the player is standing on.
